I am a Software Engineer and Tech Lead at Quave, where I have been working for the past 2.5 years, currently serving as a Tech Lead for the last 6 months. Throughout my time at the company, I have been deeply involved with the Meteor.js ecosystem, contributing not only to production systems but also to Meteor packages themselves.

I hold a degree in Computer Engineering, completed in 2025. During my academic journey, I had foundational exposure to languages such as Python, C, and C++, as well as core computer science concepts including data structures, algorithms, graph theory, and databases. I also had strong contact with electronics, working on several projects involving hardware-based automation, which helped me develop a solid systems-thinking mindset and a practical approach to problem solving.

I was the main developer behind Quave Cloud during its first year, taking ownership of critical features such as the billing and payments module. I have also participated in major architectural transitions, including the rewrite of a React Native application using Meteor.js, which reached production in approximately five months.

Currently, I act as Tech Lead on a project that involved rewriting a legacy PHP system into Meteor.js for one of the largest logistics platforms for exchanges and returns in Brazil, used by enterprise customers like Samsung. In this role, I actively participate in technical architecture decisions as well as product-level discussions, ensuring that the proposed solutions are aligned with business goals and real customer needs. The platform is already live, handling high traffic volumes with a very low number of bugs and strong production stability.

I apply AI across implementation, reviews, and task tracking, with a bias toward automating anything done more than once. I built an in-repo Cursor harness (skills and commands) for end-to-end GitHub workflows, where agents open issues, implement changes, and open PRs, with automated checks for code quality, security, performance, and Meteor 3 compatibility.

From a working style perspective, I strongly value overcommunication, frequent progress updates, and continuous validation of ideas and solutions. I believe that high-quality software is built through alignment between engineering, product, and business. I also care deeply about knowledge sharing and maintainability, striving for codebases that are clean, well-structured, and easy to understand by developers at any technical level.

I have a strong sense of ownership and consistently aim to deliver both quality and speed in my work. I am genuinely passionate about solving problems, discussing solutions, and building reliable systems that create real value for users and businesses.
